CAUSES OF HAIR LOSS

Hair loss is clinically referred to as alopecia and can generally be divided into **two types**:

① **scarring** and ② **non-scarring** alopecia.

① **Scarring** alopecia involves the inflammation and permanent destruction of the hair follicle complex. It is typically the result of an inflammatory medical condition, usually accompanied by erythema (redness) and scarring.

② **Non-scarring** male and female pattern hair loss (Androgenetic alopecia) is a condition which affects approximately 50% of both men and women over the course of their lifetime.

Androgenetic alopecia results in the gradual thinning beginning at the vertex or crown of the scalp to the forehead. By the age of 50 approximately 85% of men have significantly thinning hair – beginning with symptoms around the age of 21. Men commonly show temporal recession and vertex involvement which can progress to total baldness.

Patients may be affected at very early ages and existing treatment options have shown to be only marginally successful at preventing or reversing hair loss. Many of the preferred medications have produced poor, inconsistent results, at times including sexually adverse effects making them much less popular. Surgical hair restoration can be very expensive, painful and invasive – many times producing results that are not cosmetically appealing.

An initial evaluation by **CAMPBELL MEDICAL CLINIC** will help determine the cause of your hair loss and whether you are a candidate for PRP® therapy.

ARE YOU A CANDIDATE FOR PRP®?

PRP® therapy can reverse thinning of the hair and reactivate hair follicles in the affected areas thereby promoting a return of a normal hair growth pattern and fuller head of hair.

PRP® has been shown to be very effective for some patients with male and female pattern hair loss but it may not be beneficial for patients with scarring alopecia or complete hair loss. Early intervention, while the hair follicles are still present, is critical for PRP® treatments to be effective.

ADVANTAGES OF PRP® THERAPY

- Simple, non surgical procedure
- Multiple Injections: procedure lasting approximately **30 minutes**
- Safe and reliable results
- Very quick recovery period
- Beautiful and above all extremely natural looking end results

RESULTS

30 days after 1 treatment

**2 treatments 30 days apart
done in a series of 3 monthly treatments**

individual results may vary

PLATELET RICH PLASMA®

Platelet Rich Plasma (PRP) therapy has been used effectively in multiple fields of medicine including orthopedics, pain relief, wound healing and most recently – dermatology.

PRP which is derived from the patient's own blood contains more than 30 active proteins and seven growth factors that are critical in tissue healing, stem cell activation and neovascularization.

These proteins and growth factors, when injected into the patient's scalp, support stem cell migration, promote blood vessel growth, and stimulate protein and collagen synthesis – all of which are important in promoting new hair growth.
